

# Carbon Grounds - AWS Deployment Command Reference

## Server Info

EC2 Host: 43.204.144.76

SSH User: ubuntu

SSH Key: harshit-lakra.pem

Frontend (Next.js, PM2 process 'carbon-grounds-admin'): ~/carbon-grounds-admin

Backend (NestJS, PM2 process 'carbon-grounds-api'): ~/carbon-grounds-backend

Nginx routes: / -> localhost:3000 (frontend), /api/ -> localhost:3001 (backend)

## Connect

```
ssh -i "harshit-lakra.pem" ubuntu@43.204.144.76
```

## Update + Restart Backend (after code changes)

```
cd ~/carbon-grounds-backend
git pull # or re-upload changed files via scp/rsync
npm install --omit=dev # only if package.json changed
npm run build
pm2 restart carbon-grounds-api
pm2 logs carbon-grounds-api --lines 50 # verify it came up clean
```

## Update + Restart Frontend

```
cd ~/carbon-grounds-admin
git pull
npm install --omit=dev # only if package.json changed
npm run build
pm2 restart carbon-grounds-admin
pm2 logs carbon-grounds-admin --lines 50
```

## PM2 Day-to-Day

```
pm2 list # status of both processes
pm2 logs # tail all logs
pm2 logs carbon-grounds-api # tail one process
pm2 restart all # restart everything
pm2 stop carbon-grounds-api # stop one
pm2 delete carbon-grounds-api # remove; re-'pm2 start' fresh if wedged
pm2 save # persist current process list
pm2 monit # live CPU / memory view
```

## Nginx (only if touching the reverse-proxy config)

```
sudo nano /etc/nginx/sites-available/carbon-grounds
sudo nginx -t # test config before reloading
sudo systemctl reload nginx # or 'restart' if reload isn't enough
```

## Push Local Changes Without Git (rsync fallback)

```
# Run from your local machine, in the repo root:
rsync -avz -e "ssh -i harshit-lakra.pem" --exclude node_modules --exclude .next \
  ./ ubuntu@43.204.144.76:~/carbon-grounds-admin/
```

## Initial One-Time Setup Scripts (already in repo)

```
deploy-frontend.sh          # frontend: install, build, pm2 start, pm2 save
carbon-grounds-backend/deploy.sh  # backend: node/pm2/nginx install + config + start
```

*Note: confirm whether ~/carbon-grounds-admin on the server is an actual git clone (run 'git remote -v' there). If it isn't, use the rsync fallback instead of git pull.*
